

Q26)

Ans.)

Differences b/w DDL, DML & DCL commands in SQL

① DDL: (Data Definition Language)

→ DDL commands are used to define or modify the structure of database objects such as tables, schemas, and indexes.

• Example: ① CREATE ② ALTER

→ ① CREATE TABLE Students(
Student ID int,
Name varchar(20)
);

→ ② ALTER TABLE Students
ADD Email varchar(50);

* Scenario: → A university database admin needs to create a new table to store student records or add a new column for phone no.

② DML (Data Manipulation Language)

→ DML Commands are used to insert, update, delete & retrieve data from tables.

* Examples → ① INSERT ② UPDATE

① INSERT INTO Student values (101, "Rahul");

② UPDATE Students
SET name = 'ANURAG'
WHERE StudentID = 101;

- Scenario → When a new student enrolls, the admin inserts the student info. into the students table or update details such as address or phone no. later.

③ DDL (Data Control Language)

→ used to control access and permissions in the databases.

* Example ① Grant ② Revoke

① GRANT select ON Students to user1;

② REVOKE select ON Students from user1;

- Scenario :- In a company database, the admin grants permission to employees to view certain tables but may revoke access if they leave the department.
